

HealthGrid AI — User Guide

How to drive the district command center, the copilot, and the field voice updates. For the team + demo day.

HealthGrid has **two screens**: the **Command Center** at / (the District Health Officer's view — map, AI analysis, approvals) and the **Field screen** at /field (the health worker's view — voice and button updates). Everything is live: any update on the field screen changes the command center within seconds, no refresh.

Reading a facility

- **Health score** (0–100): computed from medicines (40), staffing (25), beds (15), patient surge (10), diagnostics (10).
- **Colors everywhere**: **green** = healthy (80+), **amber** = at risk (60–79), **red** = critical (below 60).
- **“5 days left”** on a medicine = forecast days until stock-out at the current consumption rate.

1 · The Command Center (/)

The command center: live map (left), recommended actions + AI situation analysis (right), activity ticker (bottom).

1. **Top bar** shows the district pulse: healthy/at-risk/critical counts, patients today, pending actions. The green LIVE dot means realtime sync is on.
2. **Click any dot on the map** to open that facility's panel. Critical and at-risk facilities always show their names.
3. **RECOMMENDED ACTIONS** (top right): AI-proposed stock transfers. Each card shows quantity, route, distance, reasoning, expected impact, and a confidence bar. Click **Approve transfer** — stock moves between the two facilities instantly and both re-score. **Dismiss** hides a card.
4. **AI SITUATION ANALYSIS**: for every non-healthy facility, an explanation of why — each claim cites real numbers. Click a card to jump to that facility.
5. **Copilot** button (top right) opens the assistant drawer. **Field view** → switches to the worker screen.

2 · Facility panel

Seloo PHC selected: score ring, breakdown bars, live operations strip, per-medicine forecasts.

- **Score ring + breakdown:** which of the five components is dragging the facility down (e.g. Medicines 0/40 = supply crisis).
- **Operations strip:** patients today (with 7-day trend), doctors present vs sanctioned, bed occupancy.
- **Medicine inventory:** sorted most-urgent first. Sparkline = 30-day consumption. Badge = days of supply left.
- **Diagnostics:** red chip = test unavailable at this facility.
- Click ← **Back to district analysis** under the panel to return to the AI rail.

3 · Health Copilot

The copilot drawer with suggested questions.

Ask anything about the district in **English or Hindi**. The copilot answers only from live data — it calls the same engines the screen uses. Try:

- “Why is Seloo critical?”
- “District summary”

– “Which medicines run out within 7 days?”

“कौन सी दवाइयाँ खत्म होने वाली हैं?”

4 · Field screen (/field)

The worker's screen on a phone: voice update, stock entry, steppers, test toggles.

Voice update (the star of the demo)

1. Open /field on a phone or laptop with a microphone. On first open, **choose your language** — ■■■■■, ■■■■■ or English. The whole screen switches to that language (change it anytime from the top bar).
2. Allow mic access when asked, then **press and hold** the big circular mic button.
3. Speak naturally, then release. Example:
“आज ओआरएस का स्टॉक 50 बचा है” (Aaj ORS ka stock 50 bacha hai)
4. A confirmation card appears with the transcript and the parsed update. Check it, then tap ■■■■■ ■■■■■ · **Confirm**.
5. Watch the command center (other tab/laptop): the facility re-scores and the map dot reacts within seconds.

If it says “■■■■ ■■■■ ■■■■” (low confidence), speak again — slower, closer to the mic. Nothing is ever written to the database without the on-screen confirm.

Manual updates

- **Medicine stock:** pick the medicine, type the counted stock, Save.
- **Beds / Doctors:** use – / + then Save.
- **Tests:** tap a test to toggle it between available and down.

5 · The 3-minute demo flow

1. **Open the command center.** Let the map breathe for 3 seconds — one facility glows red. “This is Wardha district, 15 public health facilities, 1,600 patients a day.”
2. **Click Seloo PHC.** Read the score ring and breakdown. “HealthGrid doesn't just show data — it explains it.” Read the AI root causes aloud.

- 3. **Point at the forecast:** “ORS runs out in 2 days. Paracetamol in 5. This is known TODAY, not in next month's report.”
- 4. **Approve the ORS transfer** in Recommended Actions. Watch both facilities re-score live. “One click. 378 patients protected.”
- 5. **Open the Copilot**, ask “Why is Seloo critical?”, then one question in Hindi.
- 6. **Switch to the phone.** Hold the mic, speak the ORS line in Hindi, confirm.
- 7. **Cut back to the command center:** the ticker logs the voice update, the score moves. “From a health worker's voice to the district's decision screen — in four seconds.”

6 · Operations & troubleshooting

Reset the demo data	<code>npm run seed -- --demo-date <today> then npx tsx --env-file=.env.local scripts/seed-ai-state.ts</code>
Verify all API keys	<code>npm run check-keys</code>
Run engine tests	<code>npm test</code> (45 tests)
Mic doesn't start	Voice needs localhost or HTTPS. Check the browser's mic permission (padlock icon).
Copilot “momentarily unavailable”	Gemini free-tier quota (20 requests/day/model) is exhausted. Fix: create the API key on the billing-en
Map is blank	NEXT_PUBLIC_MAPS_API_KEY missing/invalid, or Maps JavaScript API not enabled. A facility list
